OpenWrt Project

TP-Link Archer C5 v4

This page was created specifically for the Archer C5 v4 which uses a MediaTek SoC. (Earlier C5 v1.x and v2.x HW versions use Qualcomm and Broadcom SoC respectively)

This is a Dual band router with 5 Gigabit (1000Mbps) ethernet ports and a single USB2 port. It is advertised as AC1200 for its 867Mbps (2×2) 5GHz band and 300 Mbps (2×2) 2.4GHz band.

There is also a 'C5 W v4' offered in some countries such as Brazil.

Front - Back - Version

Supported Versions

Brand	Model	Version	Current Release	OEM Info	Forum Topic	Technical Data
TP-Link	Archer C5	v4	external image	https://www.tp-link.com/us/support/download/archer-c5/ [https://www.tp-link.com/us/support/download/archer-c5/]	https://forum.openwrt.org/t/support-for-new-archer-c5-v4/15889 [https://forum.openwrt.org/t/support-for-new-archer-c5-v4/15889]	View/Edit data

Hardware Highlights

Model	Version	SoC	CPU MHz	Flash MB	RAM MB	WLAN Hardware	WLAN2.4	WLAN5.0	Gbit ports	USB
Archer C5	v4	MediaTek MT7620A	580	8	64	MediaTek MT7620A, MediaTek MT7612E	b/g/n	a/n/ac	5	1x 2.0

Installation

→ Install OpenWrt (generic explanation)

The good news : OpenWrt is working properly on the device. However, the official device support is still work in progress.

The following procedure works only on the **V4** model. Please, don't try this on any other revision.
You can check which version your Archer C5 is by looking at the bottom of it or, in the router's web interface, **Status** page, **Hardware Version** information, if you are using stock firmware.

You can download the unofficial images from this location https://github.com/benwht/openwrt/releases [https://github.com/benwht/openwrt/releases]

Installation via TFTP (Recovery mode)

It is possible to install OpenWrt over TFTP on this device. However, in some older bootloader versions this function is broken and you can't use it. More info can be found in the U-Boot section.

→ generic.flashing.tftp

Download the `tftp-recovery` image from https://github.com/benwht/openwrt/releases [https://github.com/benwht/openwrt/releases]:

openwrt-19.07.3-ramips-mt7620-tplink_c5-v4-squashfs-tftp-recovery.bin
[https://github.com/benwht/openwrt/releases/download/19.07.3/openwrt-19.07.3-ramips-mt7620-tplink_c5-v4-squashfs-tftp-recovery.bin]

To flash the image:

1. rename the **openwrt-19.07.3-ramips-mt7620-tplink_c5-v4-squashfs-tftp-recovery.bin** to **tp_recovery.bin**
2. start a TFTP server from IP address **192.168.0.66** and serve the image named **tp_recovery.bin**
3. connect your device to the router LAN port (1-4)
4. to start the TFTP recovery process on the router, press and hold the "Reset button" and then power up the router. Keep the "Reset button" pressed until the WPS LED turns on (it's the LED with two arrows pointing in different directions)
5. If everything went well, you should see a read request on your TFTP server

Installation via serial connection

OpenWrt can be flashed via serial connection too (e.g. in case the TFTP method is not working)

Download the `factory.bin` image from https://github.com/benwht/openwrt/releases [https://github.com/benwht/openwrt/releases]:

openwrt-19.07.2-ramips-mt7620-tplink_archer-c5-v4-squashfs-factory.bin
[https://github.com/benwht/openwrt/releases/download/19.07.2/openwrt-19.07.2-ramips-mt7620-tplink_archer-c5-v4-squashfs-factory.bin]

openwrt-18.06.7-ramips-mt7620-tplink_c5-v4-squashfs-factory.bin [https://github.com/benwht/openwrt/releases/download/18.06.7/openwrt-18.06.7-ramips-mt7620-tplink_c5-v4-squashfs-factory.bin]

To flash the image:

1. rename the **openwrt-19.07.2-ramips-mt7620-tplink_archer-c5-v4-squashfs-factory.bin** to **test.bin**
2. start a TFTP server from IP address **192.168.0.225** and serve the image named **test.bin**
3. connect your device to the router LAN port (1-4)
4. power up the router and press **4** on the console to stop the boot process
5. enter the following commands on the router console

```
tftp 0x80060000 test.bin
erase tplink 0x20000 0x7a0000
cp.b 0x80060000 0x20000 0x7a0000
reset
```

After a successful flash with the above methods, you will be able to directly upgrade OpenWrt via web interface.

More information is provided in the OpenWrt forum - C5 v4 [https://forum.openwrt.org/t/support-for-new-archer-c5-v4/15889].

The above installation procedure is also successful for the 'Archer C5 W', offered in some countries such as Brazil. OpenWrt forum - C5 W Brazil [https://forum.openwrt.org/t/archer-c5-w-brazil-version/46901/6]

The brazilian Archer C5(W) V4 (at least those using Archer_C5(BRWISP)v4_3.16.0_0.9.1_up(190404)_2019-04-04_09.56.27.bin) can be flashed using TFTP Recovery (without serial cable). With images generated with this patch (https://github.com/openwrt/openwrt/pull/2174 [https://github.com/openwrt/openwrt/pull/2174]), you need to add 131072 bytes (0x20000 in hex) before the image:

```
dd if=openwrt-ramips-mt7620-tplink_archer-c5-v4-squashfs-factory.bin bs=512 seek=256 of=tp_recovery.bin
```

After that, offer that file using tftp at 192.168.0.66. Start the tftp firmware recovery holding reset while powering on.

Upgrade

Download the unofficial 19.07.3 or 18.06.7 `sysupgrade.bin` image from (https://github.com/benwht/openwrt/releases [https://github.com/benwht/openwrt/releases]):

openwrt-19.07.3-ramips-mt7620-tplink_c5-v4-squashfs-sysupgrade.bin [https://github.com/benwht/openwrt/releases/download/19.07.3/openwrt-19.07.3-ramips-mt7620-tplink_c5-v4-squashfs-sysupgrade.bin] (**with MediaTek's RTL8367s driver**)

openwrt-18.06.7-ramips-mt7620-tplink_c5-v4-squashfs-sysupgrade.bin [https://github.com/benwht/openwrt/releases/download/18.06.7/openwrt-18.06.7-ramips-mt7620-tplink_c5-v4-squashfs-sysupgrade.bin] (**with MediaTek's RTL8367s driver**)

Back to stock firmware

Download the official image from your country support page [https://www.tp-link.com/hu/support/download/archer-c5-v4/#Firmware].

E.g. in case of Hungary : Archer_C5_EUWISP_1206.rar [https://static.tp-link.com/2019/201902/20190204/Archer_C5_EUWISP_1206.rar].

restoring back to the stock firmware via TFTP (Recovery mode)

To flash the original TP-Link factory image:

1. extract the image and rename the **Archer_C5(EUWISP)v4_3.16.0_0.9.1_up_boot(181119)_2018-11-20_13.35.25.bin** to **tp_recovery.bin**
2. the stock firmware will not work directly! Cut 512 bytes from the beginning, e.g.:

```
dd if=Archer_C5\(BRWISP\)v4_3.16.0_0.9.1_up_boot\(190404\)_2019-04-04_09.56.27.bin of=tp_recovery.bin bs=512 skip=1
```

1. start a TFTP server from IP address **192.168.0.66** and serve the image named **tp_recovery.bin**
2. connect your device to the router (LAN port 1-4)
3. to start the TFTP recovery process on the router, press and hold the “Reset button” and then power up the router. Keep the “Reset button” pressed until the WPS LED turns on (it's the LED with two arrows pointing in different directions)
4. If everything went well, you should see a read request on your TFTP server

restoring back to the stock firmware via serial connection

To flash the original TP-Link factory image:

1. extract the stock firmware image and rename the **Archer_C5(EUWISP)v4_3.16.0_0.9.1_up_boot(181119)_2018-11-20_13.35.25.bin** to **tp_recovery.bin**
2. start a TFTP server from IP address **192.168.0.225** and serve the image named **tp_recovery.bin**
3. connect your device to the router (LAN port 1-4)
4. power up the router and press **4** on the console to stop the boot process.

5. enter the following commands on the router console

```
tftp 0x80060000 tp_recovery.bin
erase tplink 0x20000 0x7a0000
cp.b 0x80080200 0x20000 0x7a0000
reset
```

The router will reboot itself and the original TP-Link software will boot up.

How to compile a new version

Here is how you can compile a new OpenWrt version for yourself * prepare a build environment (quickstart-build-images)

```
git clone https://git.openwrt.org/openwrt/openwrt.git/
cd openwrt
git fetch --tags
git checkout v18.06.4
./scripts/feeds update -a
./scripts/feeds install -a
wget -qO- https://github.com/benwht/openwrt/commit/b57307fa1e498e9b82fe53cdcf58e6005a73baef.patch | git apply -v
wget -qO .config https://downloads.openwrt.org/releases/18.06.4/targets/ramips/mt7620/config.seed
make defconfig
make menuconfig
```

- set Target System: **MediaTek Ralink MIPS**
- set Subtarget: **MT7620..**
- set Target Profile: **TP-Link Archer C5 v4**
- **SAVE !**

  ```
  make -j1 V=s
  ```

- during the build process include the RTL8367s switch patch, select **Y**(es)

How to compile 19.07.1 version

The patch can't be picked on v19.07.1 tag without conflict, but it can be easily modified to work. (The change of platform.sh can be dropped.)

How to compile image with pre-build kmod (kernel module) package compatibility

Read the following article: https://hamy.io/post/0015/how-to-compile-openwrt-and-still-use-the-official-repository/ [https://hamy.io/post/0015/how-to-compile-openwrt-and-still-use-the-official-repository/]
The most important part of the solution is step 4.

Hardware

Opening/closing the case

Note: If you do it carefully then this will NOT void your warranty as there are no parts which would be damaged

The case of the Archer C5 v4 is composed of 2 pieces:

- Top cover (white)
- Bottom cover (gray)

1. Remove the two screws on the bottom cover.
2. Use a thin object to release the top cover from the bottom cover

Putting it back together

1. Put the top cover back on

2. Press until it clicks back nicely to the bottom cover
3. Put back the screws

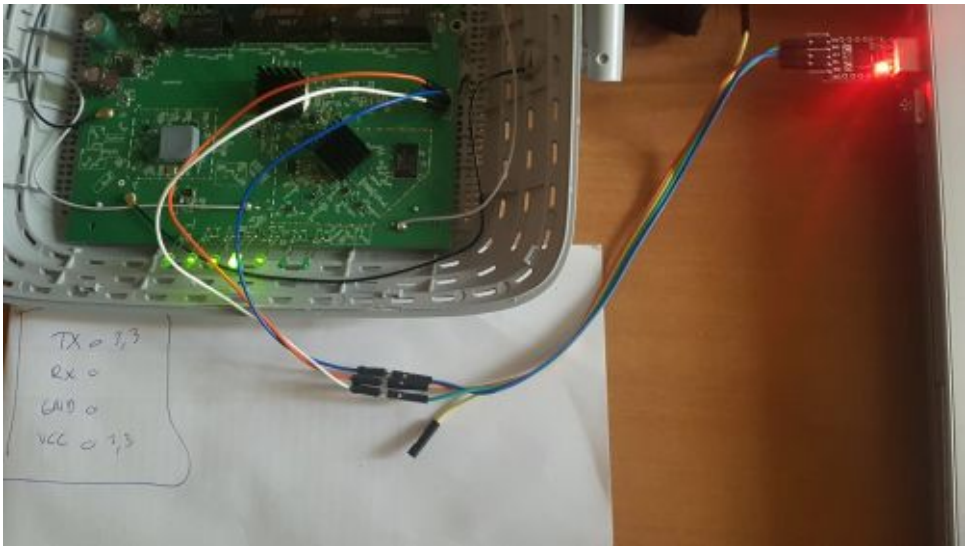
Serial connection

Serial port: TTL voltage, 115200 bps, 8N1.

Serial port layout is (NO hardware modification needed):

- (1) TX
- (2) RX
- (3) GND
- [4] VCC (3.3V)

Serial connection (click to enlarge) :



Soldering is not needed, you can connect to the serial header as shown in the picture. Don't forget that the TX pin of the serial port must linked to the RX pin of the router and the RX to TX!

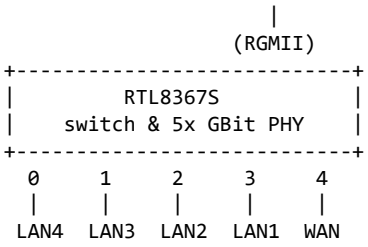
Warning: Don't connect the Vcc pin of the serial port to a TTL-to-USB adapter. This might damage the board. There's no need to connect it, communication works without Vcc.

Switch

The Archer C5 v4 uses an external Gbit switch, connected by MDIO bus. Network traffic to the CPU is passed through the internal switch of the MT7620A SoC.

MediaTek already provided a patch [https://github.com/objelf/linux/commit/32326d5eb43fc183329985c6331832d9ed155491] for Linux kernel 4.14 which adds support to the RTL8367S switch. This is what is used in the current OpenWrt v18.06 versions.

An updated OpenWrt RTL8367 driver with RTL8367S chip support is available for OpenWrt since 2019 summer, however the code is still under review process as it might affect other devices negatively. This will deliver official OpenWrt support for the device, till that happen it's backported and used in my v19.07 versions.



GPIO

```
LED
* GPIO42: POWER
* GPIO14: 2.4G LED
* GPIO12: 5G LED
* GPIO09: INTERNET_ORANGE
* GPIO10: INTERNET_GREEN
* GPIO08: LAN LED
* GPIO07: USB LED
* GPIO01: WPS LED
BTN
* GPIO13: RESET
* GPIO02: WIFI/WPS
CTRL
* GPIO60: RESET Switch
```

U-Boot

U-Boot 1.1.3 (Nov 19 2018 - 11:11:36) Ralink UBoot Version: 5.0.0.0

Press '**t**' or '**4**' to enter U-Boot command line (CLI)

```
4: System Enter Boot Command Line Interface.

U-Boot 1.1.3 (Nov 19 2018 - 11:11:36)
MT7620 #
```

Press '**7**' to download new U-Boot code

```
7: System Load Boot Loader then write to Flash via Serial.
## Ready for binary (kermit) download to 0x82000000 at 115200 bps...
```

Unfortunately the stock images dated before April of 2019 had a bug and the TP recovery function was not working on them. This can be fixed by updating the U-Boot (mtd0) to a newer version.

Latest U-Boot versions (by country, as of Feb, 2020):

- HU boot(181119), TP recovery is not working
- ES boot(190115), TP recovery is not working
- BR boot(190404), TP recovery is working properly
- BG/CZ/PL/RO/SK boot(190815), TP recovery is working properly **(tested on a HU device)**
- RU/UA boot(191017), TP recovery is working properly

Credits and forum thread

The following forum threads have been used to discuss the Archer C5 v4:

- https://forum.openwrt.org/t/support-for-new-archer-c5-v4/15889 [https://forum.openwrt.org/t/support-for-new-archer-c5-v4/15889]

Main contributors

- Serge (providing a modification to the RTL8367 switch code to support the RTL8367S chip)
- Qingfang and Luizluca (creating/maintaining a patch from Serge's source code to provide official support for the device)
- LGA1150 (his patch [https://github.com/LGA1150/openwrt/commit/4765ce0ba41deb5893e62f3344581251132c96b6] adds OpenWrt support for the device)
- gaspare
- leks
- ccc

- catalinii
- blue
- Balazs (providing help with the official kernel module packages compatibility issue during compilation)
- benwht (preparing this docs, image and a git [https://github.com/benwht/openwrt/tree/ArcherC5v4] for easy image building and update

Thanks to everyone who contributed to make this possible.
